Overview

Intune Architecture

Overview

Microsoft Intune is a cloud-based MDM and MAM service integrated with Azure AD (Entra ID). It manages device enrollment, compliance policies, configuration profiles, application deployment, and remote actions. Intune communicates with devices via the Microsoft Graph API and the Intune Management Extension agent.

Key components:

- Azure AD / Entra ID (identity and device registration)
- Intune service (policy engine)
- Intune Management Extension (IME) agent (Windows)
- Microsoft Graph API (programmatic access)
- Company Portal app (user-facing)

Enrollment types:

- Azure AD Join + Intune enrollment
- Hybrid Azure AD Join + Intune enrollment
- Intune standalone enrollment
- Co-management (SCCM + Intune)

Device platforms:

- Windows 10/11
- macOS
- iOS/iPadOS
- Android

Management channels:

- MDM channel (OMA-DM / Graph API)
- IME channel (PowerShell scripts, Win32 apps)
- Push notifications (WNS for Windows, APNs for Apple)

Key Takeaways

- Intune is the MDM layer for Azure AD / Entra ID joined devices
- The IME agent enables script execution and Win32 app deployment
- Graph API provides programmatic access to all Intune functions
- Multiple management channels increase attack surface

Jamf Pro Architecture

Overview

Jamf Pro is the dominant MDM platform for macOS in enterprise environments. It manages device enrollment, configuration profiles, policies, scripts, and software deployment. Jamf Pro communicates with devices via APNs push notifications and a proprietary check-in protocol.

Key components:

- Jamf Pro server (web application + API)
- Jamf binary (`/usr/local/bin/jamf`) on managed devices
- Jamf Connect (identity integration)
- Jamf Protect (endpoint security)
- Jamf Pro API (REST API for programmatic access)

Enrollment types:

- User-initiated enrollment (Company Portal or enrollment URL)
- Automated Device Enrollment (ADE / formerly DEP)
- Apple Configurator enrollment
- PreStage enrollment

Management channels:

- APNs push notifications (MDM commands)
- Jamf binary check-in (policies, scripts, inventory)
- Jamf Pro API (programmatic access)

Key Takeaways

- Jamf Pro is the primary MDM for macOS in enterprise environments
- The Jamf binary enables script execution and policy enforcement
- Jamf Pro API provides programmatic access to all functions
- Multiple management channels increase attack surface

Enrollment Abuse

Intune Enrollment Abuse

Tactic: Initial Access

Overview

Abuse Intune enrollment to register a rogue device under the target tenant, gaining MDM management capabilities.

Prerequisites

- Valid credentials for a user in the target tenant
- Ability to register devices (default for most users)

Steps

1. Register a device in Azure AD using the target user's credentials
2. Enroll the device in Intune via the Company Portal or automatic enrollment
3. Verify enrollment and compliance status

Commands

Register device in Azure AD

```
dsregcmd /join /debug
```

Check enrollment status

```
dsregcmd /status
```

Enroll via Company Portal (GUI)

```
Start-Process "ms-windows-store://pdp/?productid=9WZDNCRFJ3PZ"
```

Notes

- Default tenant settings allow any user to register devices
- Conditional Access policies may block non-compliant devices
- Enrollment restrictions can limit device types

Key Takeaways

- Any user can typically register devices in Azure AD
- Rogue enrollment gives MDM control over the device
- Conditional Access is the primary defense against this

Jamf Enrollment Abuse

Tactic: Initial Access

Overview

Abuse Jamf enrollment to register a rogue device under the target Jamf Pro instance, gaining MDM management capabilities.

Prerequisites

- Valid credentials for a user in the target Jamf Pro instance
- Ability to enroll devices (default for most users)

Steps

1. Enroll the device in Jamf Pro via the enrollment URL or Company Portal
2. Verify enrollment and compliance status

Commands

Enroll via enrollment URL

```
profiles -N -p https://jamf.example.com/enroll
```

Check enrollment status

```
profiles -P -v
```

Notes

- Default tenant settings allow any user to enroll devices
- Conditional Access policies may block non-compliant devices
- Enrollment restrictions can limit device types

Key Takeaways

- Any user can typically enroll devices in Jamf Pro
- Rogue enrollment gives MDM control over the device
- Conditional Access is the primary defense against this

Device Compliance Manipulation

Intune Compliance Manipulation

Tactic: Defense Evasion

Overview

Manipulate device compliance status to bypass Conditional Access policies that require compliant devices.

Prerequisites

- Rogue enrollment (see Intune Enrollment Abuse)
- Understanding of compliance policy requirements

Steps

1. Identify compliance policy requirements
2. Configure the rogue device to meet compliance requirements
3. Trigger compliance evaluation

Commands

Trigger compliance evaluation

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/managedDevices/{id}/syncDevice"
```

Check compliance status

```
Get-MgDeviceManagementManagedDevice -ManagedDeviceId {id} | Select ComplianceState
```

Notes

- Compliance evaluation can take up to 15 minutes
- Some compliance checks require hardware attestation (TPM)

Key Takeaways

- Compliance status is the gate for Conditional Access
- Rogue devices can be configured to pass compliance checks
- Hardware attestation is the strongest compliance check

Jamf Compliance Manipulation

Tactic: Defense Evasion

Overview

Manipulate device compliance status to bypass Conditional Access policies that require compliant devices.

Prerequisites

- Rogue enrollment (see Jamf Enrollment Abuse)
- Understanding of compliance policy requirements

Steps

1. Identify compliance policy requirements
2. Configure the rogue device to meet compliance requirements
3. Trigger compliance evaluation

Commands

Trigger compliance evaluation

```
jamf policy -trigger compliance
```

Check compliance status

```
jamf checkJSSConnection
```

Notes

- Compliance evaluation can take up to 15 minutes
- Some compliance checks require hardware attestation (TPM)

Key Takeaways

- Compliance status is the gate for Conditional Access
- Rogue devices can be configured to pass compliance checks
- Hardware attestation is the strongest compliance check

Configuration Profile Deployment

Intune Configuration Profile Deployment

Tactic: Persistence

Overview

Deploy configuration profiles to enrolled devices for persistence, policy modification, or security control weakening.

Prerequisites

- Rogue enrollment (see Intune Enrollment Abuse)
- Understanding of configuration profile types

Steps

1. Create a configuration profile with the desired settings
2. Assign the profile to the rogue device or a group
3. Verify deployment

Commands

Create configuration profile via Graph API

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/deviceConfigurations" -Body $profileJson
```

Assign profile to device

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/deviceConfigurations/{id}/assign" -Body $assignJson
```

Notes

- Profiles can modify security settings, install certificates, or configure VPN
- Deployment is near-real-time via push notifications

Key Takeaways

- Configuration profiles are a powerful persistence mechanism
- They can weaken security controls or install backdoors
- Deployment is fast and reliable

Jamf Configuration Profile Deployment

Tactic: Persistence

Overview

Deploy configuration profiles to enrolled devices for persistence, policy modification, or security control weakening.

Prerequisites

- Rogue enrollment (see Jamf Enrollment Abuse)
- Understanding of configuration profile types

Steps

1. Create a configuration profile with the desired settings
2. Assign the profile to the rogue device or a group
3. Verify deployment

Commands

Create configuration profile via Jamf Pro API

```
curl -X POST -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @profile.xml https://jamf.example.com/JSSResource/osxconfigurationprofiles/id/0
```

Assign profile to device

```
curl -X PUT -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @assign.xml https://jamf.example.com/JSSResource/osxconfigurationprofiles/id/{id}
```

Notes

- Profiles can modify security settings, install certificates, or configure VPN
- Deployment is near-real-time via push notifications

Key Takeaways

- Configuration profiles are a powerful persistence mechanism
- They can weaken security controls or install backdoors
- Deployment is fast and reliable

Script Execution via Intune

Intune Script Execution via IME

Tactic: Execution

Overview

Execute PowerShell scripts on managed devices via the Intune Management Extension agent.

Prerequisites

- Rogue enrollment (see Intune Enrollment Abuse)
- IME agent installed on the device

Steps

1. Create a PowerShell script
2. Upload the script to Intune via Graph API
3. Assign the script to the rogue device or a group
4. Verify execution

Commands

Upload script via Graph API

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/deviceManagementScripts" -Body $scriptJson
```

Assign script to device

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/deviceManagementScripts/{id}/assign" -Body $assignJson
```

Notes

- Scripts run as SYSTEM by default
- Execution is near-real-time via push notifications
- Script output is visible in the Intune portal

Key Takeaways

- IME enables script execution on managed devices
- Scripts run as SYSTEM, providing full control
- Execution is fast and reliable

Jamf Script Execution via Jamf Binary

Tactic: Execution

Overview

Execute scripts on managed devices via the Jamf binary.

Prerequisites

- Rogue enrollment (see Jamf Enrollment Abuse)
- Jamf binary installed on the device

Steps

1. Create a script
2. Upload the script to Jamf Pro via API
3. Assign the script to the rogue device or a group
4. Verify execution

Commands

Upload script via Jamf Pro API

```
curl -X POST -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @script.xml https://jamf.example.com/JSSResource/scripts/id/0
```

Assign script to device

```
curl -X PUT -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @assign.xml https://jamf.example.com/JSSResource/scripts/id/{id}
```

Notes

- Scripts run as root by default
- Execution is near-real-time via push notifications
- Script output is visible in the Jamf Pro portal

Key Takeaways

- Jamf binary enables script execution on managed devices
- Scripts run as root, providing full control
- Execution is fast and reliable

Application Deployment Abuse

Intune Application Deployment Abuse

Tactic: Execution

Overview

Deploy malicious applications to managed devices via Intune's application management capabilities.

Prerequisites

- Rogue enrollment (see Intune Enrollment Abuse)
- Malicious application package (MSI, EXE, or LOB)

Steps

1. Create a malicious application package
2. Upload the application to Intune via Graph API
3. Assign the application to the rogue device or a group
4. Verify deployment

Commands

Upload application via Graph API

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceAppManagement/mobileApps" -Body $appJson
```

Assign application to device

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceAppManagement/mobileApps/{id}/assign" -Body $assignJson
```

Notes

- Applications can be installed silently
- Deployment is near-real-time via push notifications

Key Takeaways

- Application deployment is a powerful execution mechanism
- Malicious applications can be installed silently
- Deployment is fast and reliable

Jamf Application Deployment Abuse

Tactic: Execution

Overview

Deploy malicious applications to managed devices via Jamf Pro's application management capabilities.

Prerequisites

- Rogue enrollment (see Jamf Enrollment Abuse)
- Malicious application package (PKG or DMG)

Steps

1. Create a malicious application package
2. Upload the application to Jamf Pro via API
3. Assign the application to the rogue device or a group
4. Verify deployment

Commands

Upload application via Jamf Pro API

```
curl -X POST -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @app.xml https://jamf.example.com/JSSResource/packages/id/0
```

Assign application to device

```
curl -X PUT -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @assign.xml https://jamf.example.com/JSSResource/packages/id/{id}
```

Notes

- Applications can be installed silently
- Deployment is near-real-time via push notifications

Key Takeaways

- Application deployment is a powerful execution mechanism
- Malicious applications can be installed silently
- Deployment is fast and reliable

Cross-Platform Lateral Movement

Cross-Platform Lateral Movement

Tactic: Lateral Movement

Overview

Leverage MDM access to move laterally between Windows, macOS, iOS, and Android devices in the same tenant.

Prerequisites

- Rogue enrollment on multiple platforms
- Understanding of cross-platform management capabilities

Steps

1. Enroll devices on multiple platforms
2. Identify high-value targets
3. Deploy scripts or applications to target devices

Commands

List all managed devices

```
Get-MgDeviceManagementManagedDevice | Select DeviceName, OperatingSystem, ComplianceState
```

Deploy script to specific device

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/deviceManagementScripts/{id}/assign" -Body $assignJson
```

Notes

- Cross-platform movement is a key advantage of MDM abuse
- Each platform has different management capabilities

Key Takeaways

- MDM enables cross-platform lateral movement
- Each platform has different attack surfaces
- Cross-platform movement is difficult to detect

Persistence Techniques

Persistence Techniques

Tactic: Persistence

Overview

Maintain persistent access to managed devices via MDM configuration.

Prerequisites

- Rogue enrollment (see Intune Enrollment Abuse)
- Understanding of persistence mechanisms

Steps

1. Deploy persistence mechanisms via configuration profiles or scripts
2. Verify persistence survives reboots and policy changes

Commands

Deploy persistence script via Graph API

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/deviceManagementScripts" -Body $persistScriptJson
```

Notes

- Persistence can survive reboots and policy changes
- Multiple persistence mechanisms increase resilience

Key Takeaways

- MDM enables persistent access to managed devices
- Persistence can survive reboots and policy changes
- Multiple persistence mechanisms increase resilience

Evasion Techniques

Evasion Techniques

Tactic: Defense Evasion

Overview

Evade detection while maintaining MDM access to managed devices.

Prerequisites

- Rogue enrollment (see Intune Enrollment Abuse)
- Understanding of detection mechanisms

Steps

1. Identify detection mechanisms
2. Implement evasion techniques
3. Verify evasion effectiveness

Commands

Check for detection mechanisms

```
Get-MgDeviceManagementManagedDevice | Select DeviceName, ComplianceState
```

Notes

- Evasion techniques can be detected by behavioral analysis
- Multiple evasion techniques increase resilience

Key Takeaways

- MDM enables evasion of detection mechanisms
- Evasion techniques can be detected by behavioral analysis
- Multiple evasion techniques increase resilience

Detection Opportunities

Detection Opportunities

Tactic: Detection

Overview

Detect MDM abuse by monitoring for anomalous enrollment, configuration changes, and script execution.

Prerequisites

- Understanding of MDM abuse techniques
- Access to Intune and Azure AD logs

Steps

1. Monitor for anomalous device enrollment
2. Monitor for configuration profile changes
3. Monitor for script execution
4. Monitor for application deployment

Commands

Query Intune audit logs

```
Get-MgDeviceManagementAuditLog | Where-Object {$_.ActivityType -eq "Enroll device"}
```

Query Azure AD sign-in logs

```
Get-MgAuditLogSignIn | Where-Object {$_.DeviceDetail.IsManaged -eq $false}
```

Notes

- Detection can be challenging due to legitimate MDM activity
- Behavioral analysis is more effective than signature-based detection

Key Takeaways

- MDM abuse can be detected by monitoring for anomalous activity
- Behavioral analysis is more effective than signature-based detection
- Detection can be challenging due to legitimate MDM activity

Jamf Architecture

Jamf Architecture

Overview

Jamf Pro is the dominant MDM platform for macOS in enterprise environments. It manages device enrollment, configuration profiles, policies, scripts, and software deployment. Jamf Pro communicates with devices via APNs push notifications and a proprietary check-in protocol.

Key components:

- Jamf Pro server (web application + API)
- Jamf binary (`/usr/local/bin/jamf`) on managed devices
- Jamf Connect (identity integration)
- Jamf Protect (endpoint security)
- Jamf Pro API (REST API for programmatic access)

Enrollment types:

- User-initiated enrollment (Company Portal or enrollment URL)
- Automated Device Enrollment (ADE / formerly DEP)
- Apple Configurator enrollment
- PreStage enrollment

Management channels:

- APNs push notifications (MDM commands)
- Jamf binary check-in (policies, scripts, inventory)
- Jamf Pro API (programmatic access)

Key Takeaways

- Jamf Pro is the primary MDM for macOS in enterprise environments
- The Jamf binary enables script execution and policy enforcement
- Jamf Pro API provides programmatic access to all functions
- Multiple management channels increase attack surface

Jamf Enrollment Abuse

Jamf Enrollment Abuse

Tactic: Initial Access

Overview

Abuse Jamf enrollment to register a rogue device under the target Jamf Pro instance, gaining MDM management capabilities.

Prerequisites

- Valid credentials for a user in the target Jamf Pro instance
- Ability to enroll devices (default for most users)

Steps

1. Enroll the device in Jamf Pro via the enrollment URL or Company Portal
2. Verify enrollment and compliance status

Commands

Enroll via enrollment URL

```
profiles -N -p https://jamf.example.com/enroll
```

Check enrollment status

```
profiles -P -v
```

Notes

- Default tenant settings allow any user to enroll devices
- Conditional Access policies may block non-compliant devices
- Enrollment restrictions can limit device types

Key Takeaways

- Any user can typically enroll devices in Jamf Pro
- Rogue enrollment gives MDM control over the device
- Conditional Access is the primary defense against this

Jamf Policy Abuse

Jamf Policy Abuse

Tactic: Execution

Overview

Abuse Jamf policies to execute scripts, install packages, or modify configurations on managed devices.

Prerequisites

- Rogue enrollment (see Jamf Enrollment Abuse)
- Understanding of policy types

Steps

1. Create a policy with the desired actions
2. Assign the policy to the rogue device or a group
3. Trigger policy execution

Commands

Create policy via Jamf Pro API

```
curl -X POST -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @policy.xml https://jamf.example.com/JSSResource/policies/id/0
```

Trigger policy execution

```
jamf policy -trigger {trigger}
```

Notes

- Policies can execute scripts, install packages, or modify configurations
- Execution is near-real-time via push notifications

Key Takeaways

- Policies are a powerful execution mechanism
- They can execute scripts, install packages, or modify configurations
- Execution is fast and reliable

Jamf Script Execution

Jamf Script Execution via Jamf Binary

Tactic: Execution

Overview

Execute scripts on managed devices via the Jamf binary.

Prerequisites

- Rogue enrollment (see Jamf Enrollment Abuse)
- Jamf binary installed on the device

Steps

1. Create a script
2. Upload the script to Jamf Pro via API
3. Assign the script to the rogue device or a group
4. Verify execution

Commands

Upload script via Jamf Pro API

```
curl -X POST -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @script.xml https://jamf.example.com/JSSResource/scripts/id/0
```

Assign script to device

```
curl -X PUT -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @assign.xml https://jamf.example.com/JSSResource/scripts/id/{id}
```

Notes

- Scripts run as root by default
- Execution is near-real-time via push notifications
- Script output is visible in the Jamf Pro portal

Key Takeaways

- Jamf binary enables script execution on managed devices
- Scripts run as root, providing full control
- Execution is fast and reliable

Jamf Configuration Profiles

Jamf Configuration Profile Deployment

Tactic: Persistence

Overview

Deploy configuration profiles to enrolled devices for persistence, policy modification, or security control weakening.

Prerequisites

- Rogue enrollment (see Jamf Enrollment Abuse)
- Understanding of configuration profile types

Steps

1. Create a configuration profile with the desired settings
2. Assign the profile to the rogue device or a group
3. Verify deployment

Commands

Create configuration profile via Jamf Pro API

```
curl -X POST -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @profile.xml https://jamf.example.com/JSSResource/osxconfigurationprofiles/id/0
```

Assign profile to device

```
curl -X PUT -H "Authorization: Bearer $TOKEN" -H "Content-Type: application/xml" -d @assign.xml https://jamf.example.com/JSSResource/osxconfigurationprofiles/id/{id}
```

Notes

- Profiles can modify security settings, install certificates, or configure VPN
- Deployment is near-real-time via push notifications

Key Takeaways

- Configuration profiles are a powerful persistence mechanism
- They can weaken security controls or install backdoors
- Deployment is fast and reliable

Cross-Platform Movement

Cross-Platform Lateral Movement

Tactic: Lateral Movement

Overview

Leverage MDM access to move laterally between Windows, macOS, iOS, and Android devices in the same tenant.

Prerequisites

- Rogue enrollment on multiple platforms
- Understanding of cross-platform management capabilities

Steps

1. Enroll devices on multiple platforms
2. Identify high-value targets
3. Deploy scripts or applications to target devices

Commands

List all managed devices

```
Get-MgDeviceManagementManagedDevice | Select DeviceName, OperatingSystem, ComplianceState
```

Deploy script to specific device

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/deviceManagementScripts/{id}/assign" -Body $assignJson
```

Notes

- Cross-platform movement is a key advantage of MDM abuse
- Each platform has different management capabilities

Key Takeaways

- MDM enables cross-platform lateral movement
- Each platform has different attack surfaces
- Cross-platform movement is difficult to detect

Persistence Techniques

Persistence Techniques

Tactic: Persistence

Overview

Maintain persistent access to managed devices via MDM configuration.

Prerequisites

- Rogue enrollment (see Intune Enrollment Abuse)
- Understanding of persistence mechanisms

Steps

1. Deploy persistence mechanisms via configuration profiles or scripts
2. Verify persistence survives reboots and policy changes

Commands

Deploy persistence script via Graph API

```
Invoke-MgGraphRequest -Method POST -Uri "https://graph.microsoft.com/v1.0/deviceManagement/deviceManagementScripts" -Body $persistScriptJson
```

Notes

- Persistence can survive reboots and policy changes
- Multiple persistence mechanisms increase resilience

Key Takeaways

- MDM enables persistent access to managed devices
- Persistence can survive reboots and policy changes
- Multiple persistence mechanisms increase resilience

Evasion Techniques

Evasion Techniques

Tactic: Defense Evasion

Overview

Evade detection while maintaining MDM access to managed devices.

Prerequisites

- Rogue enrollment (see Intune Enrollment Abuse)
- Understanding of detection mechanisms

Steps

1. Identify detection mechanisms
2. Implement evasion techniques
3. Verify evasion effectiveness

Commands

Check for detection mechanisms

```
Get-MgDeviceManagementManagedDevice | Select DeviceName, ComplianceState
```

Notes

- Evasion techniques can be detected by behavioral analysis
- Multiple evasion techniques increase resilience

Key Takeaways

- MDM enables evasion of detection mechanisms
- Evasion techniques can be detected by behavioral analysis
- Multiple evasion techniques increase resilience

Detection Opportunities

Detection Opportunities

Tactic: Detection

Overview

Detect MDM abuse by monitoring for anomalous enrollment, configuration changes, and script execution.

Prerequisites

- Understanding of MDM abuse techniques
- Access to Intune and Azure AD logs

Steps

1. Monitor for anomalous device enrollment
2. Monitor for configuration profile changes
3. Monitor for script execution
4. Monitor for application deployment

Commands

Query Intune audit logs

```
Get-MgDeviceManagementAuditLog | Where-Object {$_.ActivityType -eq "Enroll device"}
```

Query Azure AD sign-in logs

```
Get-MgAuditLogSignIn | Where-Object {$_.DeviceDetail.IsManaged -eq $false}
```

Notes

- Detection can be challenging due to legitimate MDM activity
- Behavioral analysis is more effective than signature-based detection

Key Takeaways

- MDM abuse can be detected by monitoring for anomalous activity
- Behavioral analysis is more effective than signature-based detection
- Detection can be challenging due to legitimate MDM activity
